Orig Pub : Zh. mikrobiol., epidemiol. i immunobiologii, 1956, No 21,
91-95

Abstract : The average leukocyte count in adult rabbits is 8600 with fluctuations between 5000 and 10,000. Granulocytes and lymphocytes each account for 46% and monocytes for 3%. No seasonal fluctuations were noted. In repeated experiments with week-long and month-long intervals fluctuations were detected of 9 to 10% in the granulocyte count, 9 to 11% in the lymphocyte count and of 3 to 5% in the monocyte count. The mean blood sugar level was 105 mg. with

TITLE: Fuel-and-energy balance of SSSR. Methods of statistics and analysis

SOURCE: Ref. zh. Elektrotehnika i energetika, Abs. 5T5K

REF SOURCE: Toplivno-energeticheskiy balans SSSR. Metodologiya statisticheskoy razrabotki i analiza. Statistika, 1965, 151 str.

TOPIC TAGS: fuel consumption, specific fuel consumption, fuel statistics, electric power plant, statistic analysis

ABSTRACT: Data on the fuel-and-energy balance is given. The principal lines of fuel utilization are given in the Table. Of fuel produced in 1962, 20.7% was turned into electrical energy and 21.2%, into thermal energy. 58.1% fuel was consumed directly; 61% of electric energy produced was turned into power, 39% energy was used by industrial processes, illumination, etc. The industry used 6% of coal mined in 1962, 99% shale, 85% peat, 8% natural gas, 70% residues. Higher efficiency of fuel utilization was achieved by using natural gas, and also by utilization (at metallurgical plants) of coke and blast-furnace gases, coke rubbish, physical heat of gases, coke, metal and slags, heat from cooling systems, etc. About 60% industrial plants used less than 1000 tons fuel per year each; 31%, from 1000 to 10000 tons; 8%, from 10000 to 100000 tons; about 600 plants, over 100000 tons per year, of them

UDC: 620.9(47)

Card 1/3

ACC NR: AR6028421

about 60, over 1 million tons each. More than one-half plants has steam boiler installations. Over 90% boilers have a low output, mainly 1--2 tons steam per hour. The efficiency of these installations is usually 50--60%, i. e., substantially lower than that of large plants. Among the prime movers producing electric energy, over 260000 are low-capacity engines (60 ph on the average) which consume per one kwh by 50--60% more fuel than regional power plants. In 1962, the average efficiency of electric-energy production varied from 0.19 (East Siberia) to 0.31 (Volga area) yielding an average of 0.26 throughout SSSR. At the power plant having autonomous balance, 413 tons of conditional fuel were consumed per 1 kwh(?); at the industrial plants, 685 tons. Methods of compilating the fuel balance are examined. The importance of fuel utilization efficiency is emphasized. Bibliography of 25 titles.

Title : Furnace with a rabble plate for marine fire-tube
boilers

Periodical : Teploenergetika, 3, 52-56, Mr 1955

Abstract : The authors describe an automatic device of their
own design for feeding a marine steam fire-tube
boiler using solid fuel. The chains driving the
fire grater-bars were designed by Eng. Vasii'yev.
The grates are equipped with a rabble of triangular
cross section. The authors describe in detail the
automatic control system regulating the movement of
the stoker. The results of tests made in 1952 and
1953 are summarized in a table. Six drawings and
diagrams.

TITLE: An Automatic Polarimeter (Avtomatushkiy polyarimetr)

PERIODICAL: Pribory i Tekhnika Eksperimenta, 1957, No.4,
pp. 78 - 81 (USSR).

ABSTRACT: The operation of the polarimeter (type CA-1) is based on the relationship between the rotation ($\Delta\psi = \alpha lc$) of the plane of polarisation of light and the concentration c of the investigated optically-active material for given values of the thickness l of the solution layer and the specific rotation α of the material.

Fig.1 shows the block diagram of the polarimeter. Light from a 100 W electric lamp passes through a double-lens condenser to a polariser. The intensity of the plane polarised light is caused to vary sinusoidally (50 c.p.s.) by a magnetic-optical modulator and passes through a light filter, a polarimetric tube with the investigated substance, a quartz compensator, and analyser, and then to a photo-cell which converts the light intensity variations into an alternating current. The compensator consists of two quartz prisms: one fixed (left-hand rotation), and the other movable (right-hand rotation). To correct for refraction, a glass prism is inserted between the two quartz prisms.

Card 1/2

An Automatic Polarimeter.

120-4-22/35

The polariser and the analyser are made from polaroid film so that in the absence of an optically-active solution in the polarimetric tube, no light reaches the photo-cell. When the solution is introduced between the polariser and the analyser, light falls onto the photo-cell and its intensity depends on the angle of rotation of the plane of polarisation due to the solution. This rotation is compensated by automatic rotation of the movable quartz prism, which is servo-controlled by the phase and frequency of the photo-cell output current. The reading is obtained from projection of the scale which is directly attached to the movable prism. Fig. 3 shows the light intensity and photo-cell current oscillations for different rotation angles. Fig. 4 is a photograph of the apparatus. Constructional and operating details are given. The instrument measures from -40 to + 100° S \pm 0.1° S. There are 3 figures and 2 Slavic references.

TITLE: Objective-Glass Polarimeter with Automatic Adjustment (Obyektivnyy polyarimetr s avtomaticheskoy nastroykoy)

PERIODICAL: "Izmeritel'naya Tekhnika", No 5, Sep-Oct 1957, pp 69-72 (USSR)

ABSTRACT: The subject photoelectric objective-glass polarimeter with automatic setting, for use in the sugar industry, was designed by Kiev Plant of Control Gages (Kiyevskiy zavod kontrol'no-izmeritel'nykh priborov) on suggestion of Engineer V.I. Kudryavtsev. The first unit of this instrument, called "sakharimetr CA" was shown at the 1956 All-Union Industrial Exhibition. A second improved model, demonstrated at the 1957 All-Union Industrial Exhibition, is now being produced by the same Kiev plant. The design and operation of the instrument is described in full detail. It represents a photo-electronic optical device, the optical portion of which consists of a polarimeter and a projection system, and the electrical portion consists of an indicator, a follow-up system, an amplifier, feed blocks, and a reversible electric motor. The scale is graduated in degrees of the international sugar scale. The readings show directly the weight per cent of saccharose in the investigated medium. The measurement

Card 1/2

Objective-Glass Polarimeter with Automatic Adjustment

115-5-30/44

error is claimed to be less than with the existing conventional visual instruments. Its high sensitivity (0.05° S, or 0.017 circular degree) and accuracy make the instrument applicable also for checkups of other saccharimeters, of quartz tablets, or of cover glasses of polarimeter tubes for absence of inner stresses.

The article contains 1 photograph and 2 diagrams.

TITLE: A Mercury Illuminator in Refractometry (Rtutnyy osvetitel' v refraktometrii)

PERIODICAL: Izmeritel'naya tekhnika, 1958, Nr 6, p 83 (USSR)

ABSTRACT: A quantitative analysis of solutions is mostly made by the refractometric method, in which the refraction index of the solution depends on the quantity of dry matter dissolved in it. The refraction index depends also on the wave length of the monochromatic light used. Usually, the spectral line of sodium is employed. For higher precision a shorter wave length such as that of mercury is used. A mercury lamp has been developed which is contained in a glass bulb and is equipped with a light filter for the mercury line. The lamp is of the type PRK-4. The device indicates dry substances in solutions with an accuracy of 0.1 %. There is 1 table.

TCPIIC TAG3: level sensor, liquid level control

ABSTRACT: A simple photosensor consisting of a photodiode and a lamp fastened to the conventional tubular level gauge ("oilgauge") is proposed. The associated relay operation depends on either (a) an increase in the intensity of the light beam passing through the empty tube, when the liquid level drops or (b) a focusing of the light beam by the appearance of the liquid in the tube, when the liquid level rises. TITLE: On reliability requirements

SOURCE: Priborostroyeniye, no. 3, 1965, 7-10

TOPIC TAGS: reliability, statistical analysis, industrial equipment, instrumentation, test equipment

ABSTRACT: Reliability requirements are formulated for multiple action systems, i.e. for systems designed for continuous duty in which the components are put back into operation after every breakdown and preventative maintenance is practiced. Multiple action systems include most instrumentation, automation equipment, test equipment, machine tools, etc. Using the terminology of mass maintenance theory, the reliability of systems containing a large number of elements is determined by the "breakdown flux" and the "restitution flux." The basic breakdown flux characteristics which determine the dependability of operation in the system are the following. 1. The breakdown flux parameter $\lambda(t)$. For ordinary flux without after-effects

$$\lambda(t) = \frac{dm_{ep}(t)}{dt}$$

Card 1/8

L 42-24-65

ACCESSION NR: AP5(07784)

where $m_{cp}(t)$ is the average number of breakdowns in the time interval from 0 to t .

For a stationary flux $\lambda(t) = \text{const} = \lambda = \frac{m_{cp}}{t}$,

where m_{cp} is the average number of breakdowns in the time interval t . 2. The average turnout per breakdown T --the reciprocal of the breakdown flux parameter. 3. The probability $P(t)$ of dependable operation during time interval t . In the case of cyclic (i.e. repeated action) equipment, T and t should be measured in the number of operations instead of time units. The basic characteristic of the restoration flux is the average restoration time spent in finding and repairing failures. If there are k groups with n_1, n_2, \dots, n_k elements each and the restoration period for these elements is $\tau_1, \tau_2, \dots, \tau_k$, the average restoration time is

$$\bar{\tau}_s = q_1 \tau_1 + q_2 \tau_2 + \dots + q_k \tau_k$$

where q_i is the probability of breakdown in elements of the i -th group. For multi-action installations with a large number of elements, τ conforms to an ordinary logarithmically normal distribution law in which the probability density is given by the expression

$$f(x) = \frac{1}{\sqrt{2\pi}\sigma_x} \exp\left[-\frac{(x-x_0)^2}{2\sigma_x^2}\right],$$

Card 2/5

L 47124-65
ACCESSION NR: AP5007784

where $x = \ln t$, $x_0 = \ln t_0$ is the average value of the natural logarithm for the random quantity t . The quantile x_p of this distribution law is

$$x_p = x_0 + U_p \sigma_x,$$

where U_p is the quantile of normal distribution at $x_0 = 0$ and $\sigma_x = 1$. Thus U_p is a linear function of x .

$$U_p = ax + b,$$

where a and b are constants. This was checked against data on a year's operation of two complex test installations. The results are given in fig. 1 of the Enclosure. The maintenance convenience factor is given by

$$M = P + (1-P)P_p,$$

where P is the probability that there will be no breakdowns, $(1-P)$ is the probability of breakdowns, and P_p is the probability of successful repair. The maintenance convenience factor is calculated for 1000 cycles with a 60-minute interval for finding and repairing failures in mechanical, electrical and hydraulic testing systems. TITLE: Automatic device for airplane-flap fatigue tests. Class 42, No. 183448

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 13, 1966, 95

TOPIC TAGS: aircraft actuating equipment, aircraft maintenance, aircraft maintenance equipment, aircraft test

ABSTRACT: An Author Certificate has been issued for an automatic device for conducting fatigue tests of airplane flaps, which consists of a frame and strap system for producing loads, a hydraulic system with loading cylinders which act on the frame and strap system through strain dynamometers, and hydraulic aircraft-flap drives. To reproduce stresses corresponding to the flap-deflection angle and the flight regime, and for the maximum approximation of the experimental and operational power-loading conditions, the device has a movable rocker of truss design, on which the loading cylinders are mounted, and an axis of rotation which corresponds to the flap's axis of rotation. It is equipped with a hydraulic servo system, in which a stress dynamometer is used as a sensing element, and a feed-back transducer; a device consisting of a steel console gauge with glued-on strain gauges and a shaped cam, the

TITLE: Some problems of development of microwave amplifiers
based on negative mass of current carriers in semi-
conductors

PERIODICAL: Referativnyy zhurnal. Avtomatika i radioelektronika,
no. 11, 1961, 13, abstract 11 K98 (V sb. Poluprovod-
nik. pribory i ikh primeneniye, no. 6, M., Sov. ra-
dio, 1960, 92-102) *f*

TEXT: The calculation is given of the microwave reflex am-
plifier making use of the negative effective mass of current carri-
ers in semiconductors. It is shown that the product of the square
root of gain K and transmitted bandwidth Δf increases with the con-
centration of negative mass carriers. The problem of the intrinsic
noise of the amplifier is considered and effective temperature of

Some problems of development...

amplifier noise is evaluated. The upper limit of the effective noise temperature is 100°K for frequencies at which instability of the space charge does not occur. The comparison of the average periods of optical and acoustical scatters leads to the conclusion that acoustic scatter can be avoided by the use of a sufficiently strong electric field. It is suggested that a possibility exists of realizing an amplifier based on negative mass carriers in germanium, operating on d.c. because the amplification effect at the expense of negative mass must take place in this as well. Measurement of the voltage-current characteristic of a specimen may permit one to judge whether negative effective mass carriers are present. 8 references. *[Abstracter's note: Complete translation]*

AUTHORS: Gershenson, Ye. M.; Gurvich, Yu. A.; Litvak-Gorskaya, L. B.

TITLE: An ultra-high frequency modulator based on the Suhl effect

SOURCE: Poluprovodnikovyye pribory i ikh primenenie. Sbornik statey, no. 9,
1963, 29-35TOPIC TAGS: ultra-high frequency, modulator, Suhl effect, carrier, absorption,
surface recombination, wave guide, Lorentz force, Ge, diffusion length, Si

ABSTRACT: Modulating action of a modulator involves control of ultra-high frequency absorption by changing carrier concentration in the semiconducting material placed in the wave guide when mutually perpendicular electrical and magnetic fields are applied to this material. The setup is shown in Fig. 1 (see Enclosures). The Lorentz force thus arising deflects the carriers to one side of the plate or the other, depending on the mutual orientation of the fields. When the rate of surface recombination is substantially different on opposite sides of the plate, there occurs in the plate either an increase or decrease in total number of carriers. Tests were made on Ge ($\rho \approx 45-55$ ohm cm, diffusion length of about 2 mm) in plates 50 x 10 x 0.3 to 50 x 10 x 0.7 mm. One side of the plate was etched in boiling

Card 1/7

ACCESSION NR: AT3011981

H_2O_2 to give a surface-recombination rate of 100-300 cm/sec. The rate on the other side, which was roughened with emery paper, was about 10 000 cm/sec. This difference in rate on opposite sides gave rise to nonlinear volt-ampere characteristics, shown in Fig. 2 (see Enclosures). Relationships of depth of modulation, efficiency of modulator, and time for establishing pulse are summarized in Figs. 3, 4, and 5 (see Enclosures). The authors conclude that Si has considerable promise for modulators/computed at high power levels. Orig. art. has: 6 figures.

ABSTRACT: The authors set up experiments to study the saturation of the drift velocity of carriers in strong electrical fields by using samples of p-Ge having different values of resistivity. Measurements were made along the [100] axis. The purpose of the work was to discover the cause of discrepancy between results of K. Seeger (Phys. Rev., 114, 2, 1959) and J. Zucker (J. Phys. Chem. Solids, 12, 3/4, 1960) on high-resistance samples. Changes in carrier mobility were determined from the volt-ampere characteristics of the specimen and by the absorption of ultra-high frequency energy transmitted through it. At room temperature no saturation of drift velocity was observed, but at 77K the slope of the plotted curve at values of 3.5-7 kv/cm for the field indicates that saturation is attained. The relationship between mobility and strength of electrical field

TITLE: Magnetic-concentration effect in semiconductors

SOURCE: Fizika tverdogo tela, v. 5, no. 6, 1963, 1605-1610

TOPIC TAGS: semiconductor, magnetic-concentration effect, surface recombination, free path, electron density, hole density

ABSTRACT: The authors examine an approximation theory of changes in resistance of plates for the case when considerable changes in resistance are possible, i.e., when the ratio of electron to hole density differs from unity by an appreciable factor and when the rates of surface recombination at opposite edges differ sharply. A theory was first developed for a plate in which the thickness is small compared to the length and width. A magnetic field was considered to be directed along the width, an electrical field along the length. The values of specific resistance of the plate in the imposed fields and without the fields was computed and plotted. Such values were then obtained by experiment on an actual plate. A comparison of the two sets of values is shown in Fig. 1 (see enclosure). The authors conclude that their theory may be used to evaluate the efficiency of ultra-high-frequency modulators.

SOURCE: Ukrayins'ky*y fizy*chny*y zhurnal, v. 9, no. 9, 1964, 948-955

TOPIC TAGS: negative mass current carrier, semiconductor, amplifier, anisotropic electromagnetic absorption, germanium

ABSTRACT: H. Kromer (Prve. IRE 47, 407 (1959)) has suggested the possibility of constructing an amplifier and a generator based on negative effective masses. The authors of the present paper have investigated this question experimentally and theoretically, and come to the conclusion that such an amplifier, or generator, working on negative effective masses of the holes in Ge cannot be realized. An anisotropic absorption of electromagnetic power in germanium in a strong electric field was found. Orig. art. has: 5 figures and 4 equations.

TOPIC TAGS: semiconductor, carrier temperature, electromagnetic wave absorption, microwave measurement, anisotropy, carrier effective mass, germanium, hot carrier

ABSTRACT: This research was undertaken in connection with attempts to observe the influence of negative effective masses of holes on the absorption of electromagnetic waves in germanium. Preliminary experiments (UFZh v. 9, 918, 1964) have shown that in a strong electric field the absorption of electromagnetic power by the semiconductor exhibits an anisotropy that is caused only by the presence of a dc drawing field. The present investigation consisted of more thorough experiments in which a germanium slab was exposed simultaneously to two electromagnetic waves, one with an electric field parallel to the drawing field, and the other perpendicular to it. This was done by clamping the germanium between two round

dielectric waveguides carrying two coherent TE₁₁ waves of mutually perpendicular polarization. The measurements were made at 77K using a p-Ge sample with a resistivity of 30 ohm-cm at room temperature; a pulsed drawing field was used. The details of the apparatus and of the experiments, which were performed at the 3-cm wavelength, were described in the cited paper and in PTE v. 10, no. 3, 1965. Some unaccounted for errors that are inherent in microwave measurements, wherein the carriers are heated by placing the sample in such a way that the microwave field is parallel to the drawing field, are briefly discussed. These cast doubts on the accuracy of results obtained by A. F. Gibson et al. (J. Phys. Chem. Sol. v. 19, 1951, 1961 and elsewhere). The results show conclusively that absorption of electromagnetic waves by hot carriers in a semiconductor depends on the mutual orientation of the drawing electric field and the electric field vector of the wave. "The authors are grateful to L. A. Plokhova for participating in the experiments." Orig. art. [02] has: 3 figures and 3 formulas.

magnetoconcentration effect, modulator

ABSTRACT: Control of Ge conductivity through the variation of the minority carrier concentration during injection, exclusion, and in the magnetoconcentration effect is investigated. To achieve adequate efficiency for a modulator using the increased carrier-concentration effect, resulting from the introduction of carriers through a p-n junction (injection), it is necessary to use a pure high-impedance material (~ 50 ohm. cm). Moreover, carrier concentration should vary in it 15--20 times, which corresponds to variations in resistivity from 50 to 3.5--2.5 ohm. cm. When use is made of the phenomenon of exclusion, which means that

the specimen is deficient in minority carriers, a substantial variation in the impedance of high-resistance Ge can be produced by direct SHF-power heating. It is calculated that with the use of the magnetoconcentration effect with the specimen resistivity of over 45 ohm. cm, a diffusion length of 2-3 mm and recombination rates on the faces of $S_2 \approx 100$ cm/sec and $S_1 \approx 10^4 - 10^5$ cm/sec, the impedance is expected to vary by factors of 10-20 (with an increase in the total quantity of carriers) and by factors of 2-3 (with a decrease in the quantity of carriers). All these above-mentioned effects are recommended for use in the development of waveguide-type SHF modulators which, in principle, are absorption devices. Diagrams of the arrangement of thin Ge specimens in waveguides, as well as a block diagram of an experimental system, are given in the original article. A description is given of the methods of measuring the basic parameters of a modulator. G. Slobodenyuk. [Translation of abstract]

TITLE: Semiautomatic system⁴⁴ for sealing metal to glass in cathode-ray tubes.
 Class 21, No. 171947

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 12, 1965, 45
 TOPIC TAGS: semiautomatic sealing system, cathode ray tube, cathode ray tube construction

ABSTRACT: An Author Certificate has been issued for a system for sealing metal to glass in cathode-ray tubes. To improve the efficiency of the system, eliminate intermediate furnace annealing, and maintain the desired temperature in the interval between the glass neck and metallic cone, the system is equipped with an electric heater.
